

SYNC Roles Module User Manual

Role Management — Complete Operating Guide

This manual documents the Roles Module end to end: what a role is and how SYNC decides what a signed-in user may see and do, how to read the Role Management list, every field on the role form and what to put in it, how the permission grid works and the rules that govern ticking it, how to build a role on top of one of the built-in roles, how a role is put on a user, and what every page and every button-level permission actually grants. Each screen, field and message described here was taken from the working system.

Document Title	SYNC Roles Module User Manual
Subtitle	Role Management — Complete Operating Guide
Version	1.0
Document Date	5 September 2026
Prepared By	Documentation Team
Organization	SYNC
Intended Audience	Administrators and super administrators who decide who may use which part of SYNC
Applies To	The Web Application. Roles are not created or edited in the Mobile Application
How it is organised	Part One explains how access works. Part Two is the list screen. Part Three is the role form, field by field. Part Four puts a role to work on real people. Part Five is reference for everybody.

Role Management sits under Users > Roles. If it does not appear in your menu, your own role does not hold it — ask a super administrator. Everything in this manual assumes you are signed in to the Web Application with an account that may manage roles.

PART ONE

Understanding Roles and Permissions

Read this part before you create anything. It explains what a role is, how SYNC decides what a signed-in user may reach, and the difference between the roles that ship with the system and the ones you build yourself.

1. Introduction

Applies to: everybody who holds a role · System: Web Application

1.1 What the Roles Module Is For

Every person who signs in to SYNC holds exactly one role. That role is the whole answer to two questions: which screens appear in their menu, and which buttons appear on those screens. Change somebody's role and you change what they can reach; change the role itself and you change it for everybody holding it.

The Roles Module is where those roles are read, created, adjusted and removed. It does not create people — accounts are created in Users Management — and it does not hand a role to anybody. It defines what a role means. Putting a role on a person is one field on that person's account, and Chapter 11 covers it.

1.2 Where to Find It

Item	Where
Menu path	Users > Roles
Screen title	Role Management
What it says under the title	Manage user roles and permissions
Who can open it	Any account whose role holds the Roles Management page
Where roles are assigned	Users > Users Management, on the Role field of a user

1.3 The Words This Manual Uses

Word	What it means here
Role	A named set of permissions. One person holds one role.
Permission	A single thing a role is allowed to do. Either opening a page, or using one control on a page.
View	The permission that opens a page and puts it in the menu. Without it, nothing else on that page matters.
Action	A permission for one button on a page — Add, Edit, Delete, Approve, Pay Out and so on. Each is granted separately from the page itself.
System role	One of the eight roles that ship with SYNC. They cannot be edited or deleted, and they are marked System in the list.
Custom role	A role you created. It can be edited and deleted.
Base role	A system role that a custom role is built on top of. The custom role then holds everything that system role holds, plus whatever else you tick.
Inherited	A permission a role holds because its base role holds it, rather than because somebody ticked it.

2. How SYNC Decides What Somebody May Do

Applies to: everybody who holds a role · System: Web Application

2.1 The Two Levels

Permissions come in two levels, and they work together. The page level decides whether a screen exists for that user at all. The action level decides which of that screen's controls are drawn once they are on it.

Level	What it controls	Example
Page (View)	The entry in the menu, and the screen itself.	A role holding Job Order sees Job Order in the menu and can open it.
Action	One named button on that page. Leave it unticked and the button is not drawn.	The same role without Approve can open Job Order and read it, but cannot approve one.

This is why the two are never granted together automatically in the direction you might expect. Ticking an action ticks its page for you, because a button on a page you cannot open would be pointless. Ticking a page does not tick its actions, because read-only access to a screen is a perfectly ordinary thing to want.

2.2 The Menu Only Draws — the Server Decides

Hiding a button is a convenience, not the protection. Every request SYNC makes is checked again on the server against the same permission before anything happens. Somebody who reached a screen they should not have would still be refused the moment they tried to use it. You do not need to hide a screen twice; granting the permission is the decision, and everything else follows from it.

ORGANISATION SCOPE APPLIES ON TOP OF PERMISSIONS

A permission says what kind of thing a role may do. It never widens whose records it may do it to. An administrator with every permission in the system still only acts on records belonging to their own organisation.

2.3 When a Change Takes Effect

Change	When the person sees it
You edit a role in Role Management	On their next action in the Web Application. The server re-reads the role on every request, so access removed from a role is gone immediately, even mid-session.
You move somebody to a different role	Same — their next action. They do not have to sign out and back in.
The menu itself	Refreshes when the page is reloaded. Ask them to reload if an entry they should now have is not showing.
The Mobile Application	Refreshes a signed-in user's permissions once per launch, so a role edited while somebody is signed in takes effect the next time they open the app.

3. The Two Kinds of Role

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

3.1 System Roles

Eight roles ship with SYNC. They cover the ordinary jobs people do, they are marked System in the list, and their row offers no Edit or Delete — it says Locked instead. Their access is fixed and maintained with the product, which means two useful things: they never drift, and when a new screen is added to SYNC the roles that ought to have it get it without anybody editing anything.

System role	Who it is for	Lands on after signing in
SuperAdmin	Full access to everything, including screens added in future versions.	Dashboard
Administrator	Day-to-day running of the system.	Dashboard
Head Technician	Supervising field work and applications.	Application
Technician	Working the job orders assigned to them.	Job Order
OSP	Outside plant work orders.	Work Order
Inventory Staff	Stock and inventory categories.	Inventory
Agent	Referring customers and reading their own earnings.	Agent Dashboard
Customer	The customer's own portal, bills and support.	Customer Portal

SuperAdmin is the only role that holds everything by definition rather than by list. That is why a page added to SYNC later is available to a SuperAdmin at once, and has to be ticked into any custom role that should also have it.

3.2 Custom Roles

Anything you create is a custom role. It carries its own list of ticked permissions, it can be edited whenever the job changes, and it can be deleted once nobody holds it. Create one whenever a real job in your organisation does not match a system role — a billing clerk who must not touch configuration, a supervisor who may approve payouts but not create users, a read-only auditor.

3.3 Which One Should You Build?

If the job is...	Do this
Exactly one of the eight	Use the system role. Do not copy it into a custom role.
One of the eight, plus a little more	Create a custom role, set Start From a System Role to that role, and tick only the extras. See Chapter 9.
One of the eight, minus something	Create a custom role with no base and tick the pages the job needs. A base cannot be narrowed — you cannot inherit a role and then take something away from it.
Nothing like any of them	Create a custom role with no base and tick every page and action by hand.

PART TWO

The Role Management Screen

What the list shows you, what each badge on it means, and which controls you will and will not see on it.

4. Reading the List

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

4.1 The Columns

Column	What it shows
Role Name	The name of the role, with its badges beside it. This is the name that appears in the Role dropdown when somebody is given this role.
Description	Your own note about what the role is for. Shows "No description provided" when it was left empty.
Last Updated	The date the role was last saved.
Actions	Edit and Delete for a custom role. For a system role, the word Locked.

4.2 The Badges

Badge	Meaning
System	One of the eight built-in roles. It cannot be edited or deleted from this screen.
<Role name> +	A custom role built on a system role. The badge names the base — "Administrator +" means it holds everything an Administrator holds, plus its own extras. Hover it for the same explanation.
No badge	A custom role that stands on its own, holding only what was ticked on it.

4.3 Finding a Role

- **Search.** The search box filters on role name as you type.
- **Page size.** Show 10, 25, 50 or 100 rows at a time; 25 to begin with.
- **Paging.** First, previous, next and last, with the current page and total between them.
- **Refresh.** The circular arrow beside the Add button re-reads the list from the server.

4.4 Which Roles You Can See

The list always shows the eight system roles. Alongside them it shows the custom roles belonging to your own organisation. Custom roles created in another organisation are not listed, and cannot be edited or deleted even if you know they exist.

5. The Controls on This Screen

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

5.1 What Each One Does

Control	Where	What it does
Add (plus)	Top right	Opens an empty role form. See Chapter 6.
Refresh	Top right	Re-reads the list.
Edit (pencil)	On a custom role's row	Opens that role in the form for changes.
Delete (bin)	On a custom role's row	Asks "Are you sure you want to delete this role?" and removes it if you confirm.
Locked	On a system role's row	Not a button. It marks the row as uneditable.

5.2 If a Control Is Not There

Add, Edit and Delete are three separate permissions on the Roles Management page, and each button is only drawn when your own role holds the matching one. A missing button is not a fault — it means your role was not given that part of the page. Ask a super administrator if you believe you should have it.

You cannot see	Your role is missing
The Roles entry in the menu at all	The Roles Management page itself
The Add button	Add on Roles Management
The Edit pencil	Edit on Roles Management
The Delete bin	Delete on Roles Management

PART THREE

Creating and Editing a Role

The role form, field by field: what to type, what to pick, how the permission grid behaves while you tick it, and what the system will refuse to save.

6. The Role Form, Field by Field

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

Press Add to open an empty form titled Add New Role, or the pencil on a row to open that role as Edit Role. The two forms are identical. There are four things on it: a name, a description, a base role, and the permission grid.

6.1 The Fields

Field	Required	What to put in it
Role Name	Yes	What the role will be called everywhere in SYNC, including the Role dropdown on a user. Up to 255 characters. It must be different from every other role name, the eight system roles included. Name it after the job, not the person: "Billing Clerk", not "Maria".
Description	No	A sentence saying what the role is for and who should hold it. It is shown in the list, and it is the only place the intention behind a role is recorded. Worth filling in.
Start From a System Role	No	Leave it on "None — pick every page by hand" to build the role from nothing. Pick one of the eight to inherit everything that role holds and then only add to it. See Chapter 9.
Permissions	No, but a role with none can do nothing	The grid of pages and actions. Tick View to give the page, and tick the actions beside it to give its buttons. See Chapters 7 and 8.

6.2 Things the Form Fills In For You

You are not asked for these, and there is nothing to set. They are recorded so the list can show them and so a role stays inside your organisation.

Recorded	From
Organisation	Your own. A role you create belongs to your organisation and stays there.
Created by / updated by	The account that pressed Save.
Last Updated	The moment you pressed Save. This is the date the list shows.

6.3 Saving

Save on a new role, Update on an existing one. If anything is wrong the form stays open and says why in red at the top — it repeats what the server said rather than a status code, so the message names the field. A blank name is marked Required under the box itself.

7. The Permission Grid

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

7.1 How It Is Laid Out

The grid has three columns and is grouped into sections — Dashboards, Billing, Operations, Agent, Inventory, Tools, Configurations, Users, Logs, Customer Portal and Settings. The sections are the same groupings the menu uses, so you tick a role in the shape the person will navigate it.

Column	What it is
Page Name	The screen, written exactly as it appears in the menu.
View	One checkbox. Ticking it gives the role that page and puts it in their menu.
Actions	A checkbox per button on that page, each labelled as the button reads — Add, Edit, Delete, Approve, Pay Out, Generate and so on. A page with no named buttons has nothing here.

The grid scrolls inside its own box, and lists every page in SYNC. A page added to the product appears here on its own, so there is never a screen that cannot be granted.

7.2 Reading a Row

Take Job Order. Ticking View puts Job Order in the menu and lets the role open it and read the list. Beside it sit Approve, Failed, Tech Edit, Admin Edit, Attachment and Pre Installed — six separate buttons, each granted or withheld on its own. A role with View and nothing else has a read-only Job Order screen. That is a legitimate and common setup.

7.3 The Standard Three

Most list screens — every Configurations page, and every page under Users — offer the same three actions. They always mean the same thing.

Action	What it grants
Add	The plus button that creates a new record on that page.
Edit	The pencil on a row, and the form it opens.
Delete	The bin on a row, and the confirmation that follows it.

8. Rules the Grid Follows While You Tick It

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

The grid is not a plain list of checkboxes. Four rules run while you work, and knowing them saves a lot of confusion later.

8.1 Ticking an Action Ticks Its Page

Tick Approve on Job Order without having ticked Job Order itself, and Job Order is ticked for you. A button on a page the role cannot open would grant nothing.

8.2 Unticking a Page Clears Its Actions

Untick Job Order and Approve, Failed, Tech Edit, Admin Edit, Attachment and Pre Installed all clear with it. Taking the screen away takes its buttons away; nothing is left behind to surprise you if the page is granted again later.

8.3 Some Pairs Cannot Both Be Held

Job Order and Service Order each have two different edit forms — one written for the technician who did the work, one for the administrator who checks it. A role uses one or the other, never both, so ticking one clears the other.

On this page	These two exclude each other
Job Order	Tech Edit and Admin Edit
Service Order	Tech Edit and Admin Edit

If a base role already brings one of a pair in, the other is not offered at all. A role built on a base cannot give up half of what it inherited.

8.4 Inherited Ticks Are Locked

When the role has a base, everything the base grants shows already ticked, greyed out, and marked Inherited, with a note naming the base role. You cannot untick those — they are what the base means. You can only add to them.

9. Building a Role on Top of a System Role

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

9.1 What "Start From a System Role" Does

Pick one of the eight and the role you are building holds everything that role holds, without you ticking any of it. The grid fills in with those permissions locked and marked Inherited, and whatever you tick on top is added to them.

The important part is that the inheritance stays live. The role does not take a copy of its base — it follows it. If a screen is added to SYNC later and the base role gets it, every role built on that base gets it too, with nobody editing anything. A copied list would have gone stale the day it was saved.

9.2 Building One

1. Press Add and give the role a name and a description.
2. Set Start From a System Role to the role the job is closest to. The grid fills in and the note under the picker names what has been inherited.
3. Scroll the grid and tick only the extras. Anything already ticked and greyed is inherited and needs nothing from you.
4. Press Save. The list now shows the role with a purple "<Base> +" badge naming its base.

9.3 Choosing SuperAdmin as the Base

A role based on SuperAdmin inherits everything, including screens added in future versions. The form says so and there is nothing left to tick. Only do this deliberately: it produces a second unrestricted role under a different name.

9.4 Changing or Removing the Base Later

You do this	What happens
Switch to a different base role	Anything you had ticked that the new base already grants stops being an extra, and anything that clashes with what the new base grants is dropped. What is left is still ticked.
Set the base back to None	The role becomes a standalone custom role. It keeps every permission that was ticked on it directly, and loses the inherited ones. Check the grid before saving — the role may now be much narrower than it looks.

A SYSTEM ROLE IS NEVER ITSELF A HYBRID

The eight built-in roles do not inherit from anything. Their access is fixed with the product, which is exactly why they are safe to build on.

10. Editing and Deleting a Role

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

10.1 Editing

1. Find the role and press the pencil on its row.
2. Change the name, description, base role or ticks. The grid opens showing what the role genuinely holds today, so what you see is what it has.
3. Press Update. Everybody holding that role is affected from their next action onward.

EDITING A ROLE CHANGES IT FOR EVERYBODY HOLDING IT

There is no per-person exception. If one person needs something different, they need a different role — check the Users Management list first to see who holds this one.

10.2 Deleting

Press the bin and confirm. A role can only be deleted once nobody holds it: if anybody is still on it, SYNC refuses with "Cannot delete role that has assigned users". Move those people to another role first, then delete.

10.3 What SYNC Will Refuse

You try to	The message you get	Why
Edit a system role	System roles cannot be edited	The eight built-in roles are fixed. Build a custom role on top of one instead.
Delete a system role	System roles cannot be deleted	Same reason.
Delete a role somebody holds	Cannot delete role that has assigned users	Reassign them first.
Reuse a name	The name is already taken	Role names are unique across the whole system, system roles included.
Edit a role from another organisation	Unauthorized. You can only update roles within your organization.	Roles belong to the organisation that created them.

PART FOUR

Putting a Role to Work

A role does nothing until somebody holds it. How to assign one, how to check it came out the way you meant, and three worked examples.

11. Assigning a Role to a Person

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

11.1 On a New Account

1. Go to Users > Users Management.
2. Press Add and fill in the account: first name, last name, username, email address and a password of at least eight characters.
3. Pick the role in the Role field. Every role is listed — the eight system roles and your own custom ones, by name.
4. Save. The person can sign in immediately with what that role allows.

11.2 On an Existing Account

1. Go to Users > Users Management and open the person.
2. Press Edit, change the Role field, and save. The password can be left blank to keep the current one.
3. Their access changes on their next action. They do not need to sign out.

11.3 Where the Role Field Behaves Differently

Screen	The Role field
Users Management	A dropdown of every role. This is the normal way to assign one.
Agent Management	Fixed to Agent and shown read-only. That screen exists to create agents, so it does not offer a choice — and it reveals the agent-only fields instead. Use Users Management if the person should hold some other role.

A person holds one role at a time. To give somebody more than one job, build a role that covers both — that is what Start From a System Role is for.

12. Checking a Role Came Out Right

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

12.1 The Order to Work In

1. Write down the job in plain words first: which screens, and which buttons on them.
2. Decide whether it is one of the eight, one of the eight plus extras, or something new (Chapter 3.3).
3. Create the role, tick it, and save.
4. Assign it to one person as a trial rather than to the whole team.
5. Have that person reload SYNC and walk the job end to end.
6. Adjust the role and have them reload again. Repeat until the job runs clean.
7. Move the rest of the team on to it.

12.2 What to Look For

Symptom	What it means	Fix
A screen is missing from their menu	The page is not ticked.	Tick View for that page.
The screen opens but a button is missing	The page is ticked, the action is not.	Tick that action beside the page.
A tick will not come off	It is inherited from the base role.	Change or remove the base — an inherited permission cannot be taken away on its own.
They can see records but not the ones they expect	Not a permission at all — organisation scope.	Check the organisation on their account.
Nothing changed after you saved	Their browser is still showing the old menu.	Ask them to reload the page.

13. Three Worked Examples

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

13.1 A Billing Clerk Who May Not Configure Anything

Start from nothing and tick only what the job needs.

Page	View	Actions to tick
Customer	Yes	Transact, SO Request
Transaction List	Yes	Approve
Invoice	Yes	none
Statements	Yes	none
Overdue	Yes	none
Payment Portal	Yes	none

Leave Base as None. Nothing under Configurations or Users is ticked, so those sections never appear in their menu.

13.2 A Supervisor Who Signs Off Agent Payouts

Closest to Administrator, plus the approval. Set Start From a System Role to Administrator, then tick the extras the job needs — for example Approve on Agent Payout, and Generate and Set Status on Agent Invoices. Everything an Administrator already holds comes in inherited and locked.

13.3 A Read-Only Auditor

Base None. Tick View on every page they must read and no actions at all. They will be able to open and search each screen and change nothing on it, anywhere.

GRANT THE SMALLEST SET THAT LETS THE JOB BE DONE

It is easier to add a permission somebody turns out to need than to explain something they should not have been able to do. Start narrow and widen on request.

PART FIVE

Reference

Every page you can grant, the actions each one offers, and what to do when something does not behave.

14. Every Page You Can Grant

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

Pages are listed in the grid's own order, under the grid's own section headings, and written as the grid writes them. "Add, Edit, Delete" means the standard three described in 7.3. A dash means the page has no separate buttons — holding the page is the whole of it.

14.1 Dashboards

Page	Actions it offers
Dashboard	—
Agent Dashboard	—
Monitoring	—
Support	—

14.2 Billing

Page	Actions it offers
Customer	SO Request, Details Edit, Attachment, Transact
Transaction List	Batch Approve, Approve, Revert Request
Revert Requests	—
Payment Portal	—
Statements	—
Invoice	—
Overdue	—
SO Charge	—
DC Notice	—
Rebates	Add Rebate
Staggered	Add Staggered
Discounts	Add Discount
SOA Generation	Manage

14.3 Operations

Page	Actions it offers
Application	Move to JO, Quick Status
Job Order	Approve, Failed, Tech Edit, Admin Edit, Attachment, Pre Installed
Service Order	Tech Edit, Admin Edit

Page	Actions it offers
Radius Queue	—
Work Order	Manage
LCP/NAP Location	—
SMS Blast	—
Reports	Manage, Delete

On Work Order, Manage covers raising, reassigning and deleting a work order, as opposed to working the ones already assigned to you. On Reports, Manage covers scheduling and issuing; Delete is separate because a scheduled report is something other people rely on receiving.

14.4 Agent

Page	Actions it offers
Bonus History	Payout
Agent Invoices	Generate, Set Status, Pay Out
Agent Payout	Approve
Agent Management	—
Team Agents	—

On Agent Invoices, Set Status changes an invoice by hand while Pay Out raises the payout that settles it — the money side, granted separately on purpose. Agent Management and Team Agents have no separate action ticks: holding either page carries its Add, Edit and Delete controls with it, so grant them only to people who should manage agents outright.

14.5 Inventory, Tools and Settings

Page	Actions it offers
Inventory	—
Inventory Category List	—
SmartOLT Tool	—
Mikrotik Radius Tool	—
Xendit Reconciliation	—
Billing Reconcile	—
Settings	—

The four Tools pages are grouped apart from Configurations because they do not describe the system, they act on it — each writes corrections into a live downstream. Grant them deliberately.

14.6 Configurations

Every page in this section offers the standard three: Add, Edit and Delete.

Page	Page	Page
Promo	Plan	Location
LCP	NAP	Ports

Page	Page	Page
Router Models	Status Remarks	Usage Type
VLAN Config	Payment Method	Work Category
Radius Config	SmartOLT Config	SMS Config
SMS Template	Email Templates	PPPoE Setup
Concern Config	Billing Configurations	

14.7 Users

Page	Actions it offers
Users Management	Add, Edit, Delete
Tech Users	Add, Edit, Delete
Organization	Add, Edit, Delete
Roles Management	Add, Edit, Delete
Group Management	Add, Edit, Delete

ROLES MANAGEMENT IS ITSELF A PERMISSION

Granting a role the Roles Management page with Add and Edit lets whoever holds it change what every other role may do — including their own. Treat it as the most powerful tick on the grid and give it to very few people.

14.8 Logs

Read-only records. None of them offers a separate action.

Page	Page
Disconnected Logs	Reconnection Logs
SMS Logs	SMS Blast Logs
Email Logs	Data Logs
Expenses Log	Smart OLT Logs
Radius Logs	System Logs

14.9 Customer Portal

Page	What it is
Customer Portal	The customer's own dashboard.
Customer Bills	The customer's bills.
Customer Support	The customer's support screen.
Agent Application Form	The customer application form an agent submits.

These four belong to the Customer and Agent roles. There is rarely a reason to tick them into a staff role.

15. Troubleshooting

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

15.1 Access Problems

Symptom	Cause	What to do
A screen is missing from somebody's menu	Their role does not hold that page.	Edit the role and tick View for it, or move them to a role that has it.
They can open a screen but a button is missing	The page is granted, the action is not.	Tick that action beside the page.
They were refused after pressing something they could see	The role was edited between the page loading and the button being pressed.	Ask them to reload; the menu will then match what the role now holds.
A whole section of the menu is missing	None of the pages in that section is ticked. A section only appears when at least one page inside it does.	Tick the pages they need.
They see the right screens but the wrong records	Organisation, not permission.	Check the organisation on their account.

15.2 Problems With the Form

Symptom	Cause	What to do
Required under Role Name	The name is empty.	Type a name.
The name is rejected as taken	Another role already uses it — possibly a system role, or one in another organisation you cannot see.	Choose a different name.
A checkbox will not untick	It is inherited from the base role.	Change the base, or set it to None and tick what is needed by hand.
A checkbox is greyed out and was never ticked	The base role holds the permission it excludes — the Tech Edit and Admin Edit pair.	Nothing to do. A role cannot hold both halves of that pair.
Ticking one edit permission cleared the other	Working as intended, for the same pair.	Decide which of the two the job actually needs.
The role saved but the person still cannot do the thing	They hold a different role from the one you edited.	Check the Role field on their account in Users Management.

15.3 Problems Deleting

Symptom	Cause	What to do
Cannot delete role that has assigned users	Somebody still holds it.	Reassign them in Users Management, then delete the role.
No bin on the row	It is a system role, or your own role lacks Delete.	System roles cannot be deleted at all. Otherwise ask a super administrator.

16. Quick Reference

Applies to: ADMINISTRATOR and SUPER ADMINISTRATOR · System: Web Application

16.1 The Role Form at a Glance

Field	Required	Notes
Role Name	Yes	Unique, up to 255 characters. Appears in the Role dropdown.
Description	No	Shown in the list. Say what the role is for.
Start From a System Role	No	None, or one of the eight. Inherits live, adds only.
Permissions	No	View per page; an action per button. Only what you tick is stored.

16.2 Rules Worth Remembering

- **One role per person.** Cover two jobs by building a role, not by assigning two.
- **System roles are fixed.** They cannot be edited or deleted. Build on top of them instead.
- **Inheritance is live.** A role built on a base follows that base as the product grows.
- **An inherited permission cannot be removed.** Change the base, or build without one.
- **Editing a role affects everybody holding it.** Check who holds it before you save.
- **A role in use cannot be deleted.** Reassign its users first.
- **Names are unique everywhere.** Including the eight system roles.
- **Permissions never widen organisation scope.** Every role only ever acts on its own organisation's records.

16.3 Document Notes

Menu paths are written with a greater-than sign between the steps: Users > Roles means the Roles entry inside the Users group of the menu.

This manual describes Role Management as implemented in the Web Application at the document date on the cover. The set of pages and actions on the grid grows with the product, and the grid itself is always the current list. Where this manual and the system disagree, the system is right and this manual needs updating.
